MR42-17

Koch's Gold and Silver

Two mines. At one there is a thin (fraction of an inch up to a few inches) seam of black material in granite. This material may be basalt, but I couldn't be certain from what I saw. According to Mr. Koch, it carries values in gold and silver. He has tunneled about 50' into the granite following this black material.

The other mine is a basalt-dolerite dike in granite as far as can be told from a badly caved tunnel. Mr. Koch said it carried values in gold and in silver. Specks of pyrite in the basalt and pyrrhotite (?) in the dolerite could be seen from dump samples.

Mr. Koch believes both the above mines contain nickel values, but there is no evidence of this. No assays.

Koch's Gold and Silver
