

MR 42-23

Andreg and Copper Nickel - Henry Cooper, 2 mi. SW of Bonti Camp  
along highway.

A shaft and several pits in an igneous amphibolite (?). Very little of any sulfide showing in the rock. Some chalcopryite and perhaps others (not seen).

Granite occurs on the dump around the shaft, but none crops out in the immediate vicinity of the mine. Shaft is timbered for several feet and then there is water.

In the latest pits dug, there is a brownish mineral which is supposed to carry nickel.

(Visited with Albert R. Nelson.)
