

MR43-13

**GEOLOGICAL SURVEY OF WYOMING**

Reese Iron

A small knob of weathered and decomposed granite. It seems that only the near surface material has been altered to hematite because much of the rock, on being broken open, has a considerable amount of admixed granite.

The knob is about 110 feet high at a maximum and about 100'x 100' in horizontal dimensions. It is a fairly round hill.

**GEOLOGICAL SURVEY OF WYOMING**

Reese Iron

10-11-43

A small knob of weathered & decomposed granite. It is assumed that only the near surface material has been altered to hematite because much of the rock, on being broken open, has a considerable amount of unaltered granite.

The knob is about 10 ft high at its maximum and about 100' in horizontal dimensions. It is a fairly rounded hill.
